

Compiling ADMB programs

To compile `model.tpl` in a DOS/Linux terminal window:

```
admb [-s] [-re] model
```

where the options

- s yields the "safe" version of the exe-file
- re is used to invoke the random effect module

Two stages of compilation:

- Preprocessor: `tpl2cpp` or `tpl2rem`
- C++ compiler (Borland, Visual C++, etc.)
